## **Grover Sealant Gun Preventive Maintenance Model No. 223, 223AR, and 223AR-6**

Grover Sealant Injection Guns should provide long, trouble free service with little preventive maintenance. The following simple basic procedures may insure longer service life of the parts.

1. Sealant gun cleanliness is the most critical factor in preventive maintenance. Clean gun thoroughly after **every use** with the sealant manufacturer's recommended cleanser.
2. Each morning before operation, squeeze 2-3 squirts of 30 weight, non-detergent oil into the air intake of the air motor. An alternate solution would be to install an automatic oiler in the air line.
3. Maintain a clean air supply. Drain the air compressor regularly or install an air line filter into the main air line.
4. Disconnect the air supply to the gun when not in operation.

In case of a remote breakdown, we recommend purchasing a reserve gun to use while service is being performed.
